Once you have your kit, follow these directions. Turn off the water supply to your shower. Most showers don't have single supply valves. As a result, the water to the entire house will need to be turned off. You can do this by locating the entrance valve and turn on any of your home's water supply. Head back inside and turn on the shower faucet. This will also help drain the last of the leftover water. You'll now want to remove the handle. Typically, you'll need an Allen wrench to remove the handle (1 & 2). If you're unsure how to do this, read the owner's manual. After you have removed this screw, the bonnet nut will also have to be removed. Use a strap wrench to do this. If your faucet is old, the bonnet nut may be tough to get off. You can use a little lubricant to loosen it up. After the nut is off, remove the bonnet. Equip yourself with a pair of fine tweezers. You can also use a sharp pick too. With either of these tools, remove both the springs and the rubber seats (10). You'll find these located inside the faucet housing. Once you have removed both the springs and the removed with the picks. Take the new seats and lubricate them up. It's important to note that you should never use petroleum jelly. Vegetable oil and silicone grease are both effective lubricants. Insert the springs into the seats. Make sure that you insert the spring into the faucet. Take the ball assembly and lubricate it up. Once lubricated, insert it into the housing and make sure it's aligned properly. The cam will now need to be placed on the ball assembly. Make sure the little tab located on the ball assembly. While holding the cam down with your finger, you'll want to thread the bonnet back on and then tighten it with your strap wrench. Reconnect the handle. Turn off the faucet you're working on. Next, turn on your home's water approximately one-third of the way. This will allow your pipes to slowly fill up. It's very important not to turn the water on full blast at first. Doing so could cause the calcium that's built up on the inside of the pipes to break off and form a clog. After all the air has been removed from the pipes, you can turn it on all the way. Inspect your shower faucet for leaks and other issues. Replacing an old Delta valve cartridge Source A change in water pressure, sudden changes from hot to cold, and consistent leaking can all be a result of a faulty valve cartridge. If you know this is the problem, then instead of replacing the whole unit, you can simply just change the valve cartridge. So, how do you do this? With the handle removed, remove the bonnet nut with s strap wrench. Grab onto the valve cartridge and wiggle it back and forth while also pulling on it. With a little effort, it should come right out. Take your new cartridge and insert it. However, when inserting this piece, install the new cartridge making sure the side with the slots found in the valve. Take the bonnet nut and hand screw it back on until it's snug. Put the handle back on. You have now replaced your valve cartridge. Again, turn your water on slowly, get out all the air, and check for leaks.
